

JOB CHONG

Software Engineering | jobchong@gmail.com | linkedin.com/in/jobchong | github.com/jobchong | jobchong.org

Summary

Engineering leader with 8+ years building cloud-scale products and 3+ years leading cross-functional teams. Deep hands-on expertise in Python, Go, and TypeScript across full-stack systems and software architecture; repeatedly owned developer tooling, AI-powered workflows, and production reliability. Track record shipping LLM-driven features, building test automation frameworks, and driving metrics-driven quality improvements. Open source contributor (e.g., Codex).

Core Skills

AI integration (LLM-powered workflows, prompt engineering, model evaluation, quality and safety assessment); Developer tooling (CI/CD pipelines, test automation frameworks, code review systems, automated releases); Systems & platforms (distributed back-end services, APIs, data pipelines, observability, metric tracking); Full-stack development (UI, design systems, staged rollouts); Languages & tech: Python, Golang, TypeScript/JavaScript, HTML, CSS, SQL, React, Node.js, AWS, Docker, Kubernetes, Terraform, Postgres, Datadog, Grafana.

Experience

JPMorgan — Lead Software Engineer (VP)

2023–Present

- Built and deployed LLM-powered AI agents for back-office workflows; designed evaluation frameworks for quality, coherence, and safety assessment with human-in-the-loop controls.
- Led cross-functional delivery across engineering, product, and risk/controls stakeholders to safely ship features 30% faster in a regulated environment.
- Drove developer tooling strategy across the software development lifecycle: built CI/CD pipelines, test automation frameworks, and code review systems that cut build times by 35% and enabled rapid, safe delivery across teams.
- Designed back-end services and APIs using Java; built React-based UIs and integrated with data pipelines metric tracking.
- Delivered autoscaling services on AWS/Kubernetes with observability tooling like Grafana for robust monitoring, alerting, and performance analysis.
- Recruited and led multiple engineering teams; defined coding standards, design review practices, and quality gates that reduced production incidents for critical systems.

Grab — Software Engineer

2021–2023

- Technical lead for payments platform serving merchants across Southeast Asia; designed back-end services in Go with data pipelines for evaluation and metric tracking.
- Built dashboards, alerting, and automated testing frameworks; reduced production incidents by 50% while maintaining latency SLAs.
- Drove data-driven experimentation and statistical analysis to improve conversion by 22% through iterative feature development.
- Led cross-functional collaboration with product, risk, and partner teams to deliver compliant, extensible systems handling evolving requirements.

Legalese — Full-Stack Developer

2017–2021

- Built full-stack document-automation platform: React UI, Node.js/Python back-end services, and REST APIs hosted on AWS.
- Designed reusable SDKs and developer tooling, improving development velocity and consistency across projects.

Education

National University of Singapore — LL.B (Hons)

International Baccalaureate — 41 points

Gifted Education Programme — 2001–2007
